PATIENT GUIDE

A Guide To Genetic Testing
For Hereditary Pancreatic Cancer

Ambry Genetics®
A Konica Minolta Company
Understanding The Basics

Risk factors for developing pancreatic cancer include: cigarette smoking, type 2 diabetes, chronic pancreatitis, obesity, cirrhosis of the liver, and a family history of pancreatic cancer.

Cancer falls into 1 of 3 categories

FAMILIAL CANCER
A pattern of the same or related types of cancer within a family that may be due to genes and/or other shared factors, such as environment and lifestyle.

HEREDITARY CANCER
A pattern of the same or related types of cancer within a family due to inherited gene changes (called mutations), that can be passed from parent to child.

SPORADIC CANCER
Cancers that occur by chance in one or two family members that are not due to an inherited gene mutation. Approximately 80% of all cancers are sporadic.
Pancreatic cancer occurs in about 1 in 65 people in the U.S.

Pancreatic cancer is most frequently diagnosed among people 66-74 years old.

ABOUT HEREDITARY CANCER

Many people have a family history of cancer, but only 5-10% of pancreatic cancer is hereditary.

People who have these gene mutations are born with them – they do not develop over time.

Learning if you have an inherited mutation can help you know more about your cancer risks or can inform your medical management.

People with a higher chance of developing cancer may need screening, like colonoscopies, that start at younger ages, and occur more often.
## Should You Have Genetic Testing?

*IF YOU ANSWER “YES” TO ANY OF THE QUESTIONS BELOW, hereditary pancreatic cancer genetic testing may be something for you and/or your family members to consider.*

1. Have you/your family members* been diagnosed with pancreatic cancer?

2. Have you/your family members* been diagnosed with more than one cancer, such as pancreatic and breast cancer?

3. Have multiple people on the same side of your family had colorectal, breast, prostate, melanoma, uterine, ovarian, and/or other cancers?

4. Have any of your family members* been found to have a cancer gene mutation?

Your healthcare provider may identify other reasons why you could consider genetic testing.

*“Family members” refers to blood relatives, such as brothers/sisters/parents/grandparents/aunts/uncles/cousins*
PancNext includes 13 genes that are linked to an increased lifetime risk for one or more cancers including pancreatic cancer. The check marks below indicate the associated cancer types for each gene.

How Genetic Testing Can Impact You and Your Family

FOR YOU:

If you have been diagnosed with pancreatic cancer, results of genetic testing may impact your treatment options. Your doctor can also identify and discuss other personalized medical management options that might be appropriate based on your genetic test results.

Your test results may help your healthcare provider fine-tune your cancer screening plan, including the type, timing (age) of your initial screening, and its frequency.

Examples of cancer screening include mammogram, breast MRI, colonoscopy, prostate exam, dermatology (skin) exam, or other screenings indicated for your specific cancer risk.

Based on your results, your healthcare provider may review possible cancer prevention options with you, such as preventive, or prophylactic, surgery that can reduce the risk for certain cancers.

Examples include prophylactic mastectomy (removing one or both breasts before a cancer occurs) or prophylactic oophorectomy (removing the ovaries and Fallopian tubes before a cancer occurs).
Men and women have the same chance of inheriting a mutation, but their chance of developing cancer may be different.
Possible Genetic Test Results

**POSITIVE**

A mutation was found in at least one of your genes tested

Detection of a cancer-related gene mutation could explain that your cancer diagnosis is hereditary or be a warning that you are at increased risk compared to others.

Based on your results, genetic testing for certain family members may be recommended.

**NEGATIVE**

No genetic mutations were found in any of your genes tested

While your genetic test results were negative, personal and family history may also be a strong indicator of cancer risk(s) and may inform your medical management.

Talk to your healthcare provider to find out if genetic testing should be considered for your family members.

**VARIANT OF UNKNOWN SIGNIFICANCE (VUS)**

At least one genetic change was found, but it is unclear if this change causes an increased risk for cancer

While your genetic test results were inconclusive and do not change your medical management, personal and family history may also be a strong indicator of cancer risk(s) and may inform your care.

Talk to your healthcare provider to find out if genetic testing should be considered for your family members.

*It is possible to have a combination of positive and VUS results, since multiple genes are tested.*

1 HOW IS GENETIC TESTING PERFORMED AND HOW LONG DOES IT TAKE?

Genetic testing requires a blood or saliva sample, which is collected using a special kit that is shipped overnight to Ambry Genetics by your healthcare provider. The testing, which looks for mutations that cause an increased risk for cancer, takes less than three weeks to complete, and results are sent to your healthcare provider.

2 WHAT WILL HAPPEN WHEN MY RESULTS ARE READY?

Your healthcare provider will receive your results; they will not be sent directly to you. Every healthcare provider may have a different method and time frame for reviewing your results with you, so it is important to discuss this process with them when your test is performed. Your healthcare provider will discuss recommended next steps based on your test results.

3 WILL MY GENETIC TEST RESULTS AFFECT MY INSURANCE COVERAGE?

In the U.S., the Genetic Information Nondiscrimination Act (2008) prohibits discrimination by health insurance companies and employers, based on genetic information. Depending on where you live in the world, you may have different (or fewer) laws in this area. Visit ginahelp.org to learn more.

4 HOW WILL MY TEST RESULTS BE PROTECTED?

We are required by law to maintain the confidentiality of your protected health information in accordance with the Health Insurance Portability and Accountability Act (HIPAA). Visit HHS.gov to learn more.
5 SHOULD I TELL MY FAMILY MEMBERS ABOUT MY GENETIC TEST RESULTS?

It is important to share your results with your family members, because they may provide additional information about their own cancer risks and management options. If you feel unsure about how to approach the subject, your healthcare provider may be able to offer some advice.

6 WILL GENETIC TESTING BE COVERED BY MY INSURANCE?

Many insurance plans cover genetic testing, and Ambry Genetics is contracted with the majority of U.S. health plans. Your out-of-pocket cost may vary based on your individual plan. A team of dedicated specialists is available to help you get access to the genetic testing you need, and provide further details about our payment options. Please call or email our Billing department at +1.949.900.5795 or billing@ambrygen.com with any questions. Visit ambrygen.com/patientbilling for more information.

7 WHAT IS AN EXPLANATION OF BENEFITS (EOB)?

Your insurance company sends you an EOB to explain any services paid on your behalf. You can contact us directly to speak with a Billing specialist with any questions or concerns about Ambry Genetics genetic testing that appears on your EOB. It is important to remember that insurance companies can take several weeks or even a couple of months to process claims.
