

Understanding Your Positive *POT1* Genetic Test Result

INFORMATION FOR PATIENTS WITH A PATHOGENIC MUTATION OR VARIANT, LIKELY PATHOGENIC

4 Things To Know

1	<i>POT1</i> mutation	Your testing shows that you have a pathogenic mutation or a variant that is likely pathogenic in the <i>POT1</i> gene.
2	Cancer risks	You have an increased chance to develop melanoma, sarcoma (a cancer that develops in bones and soft tissues, including fat, muscles, blood vessels, nerves, and deep skin tissues), and possibly other cancers such as blood cancers (leukemia or lymphoma).
3	What you can do	Risk management decisions are very personal. There are options to detect cancer early or lower the risk to develop cancer. It is important to discuss these options with your doctor and decide on a plan that works for you.
4	Family	Family members may also be at risk - they can be tested for the <i>POT1</i> mutation that was identified in you. It is recommended that you share this information with family members so they can learn more and discuss this with their healthcare providers.

POT1 Mutations in the Family

There is a 50/50 random chance to pass on a *POT1* mutation to each of your children. The image to the right shows that everyone can carry and pass on these mutations, regardless of their sex at birth.

■ Has *POT1* mutation
 ■ No *POT1* mutation

Please discuss this information with your healthcare provider. The cancer genetics field is continuously evolving, so updates related to your *POT1* result, medical recommendations, and/or potential treatments may be available over time. This information is not meant to replace a discussion with a healthcare provider, and should not be considered or interpreted as medical advice.
